

MVC - Where it all started (to go wrong)

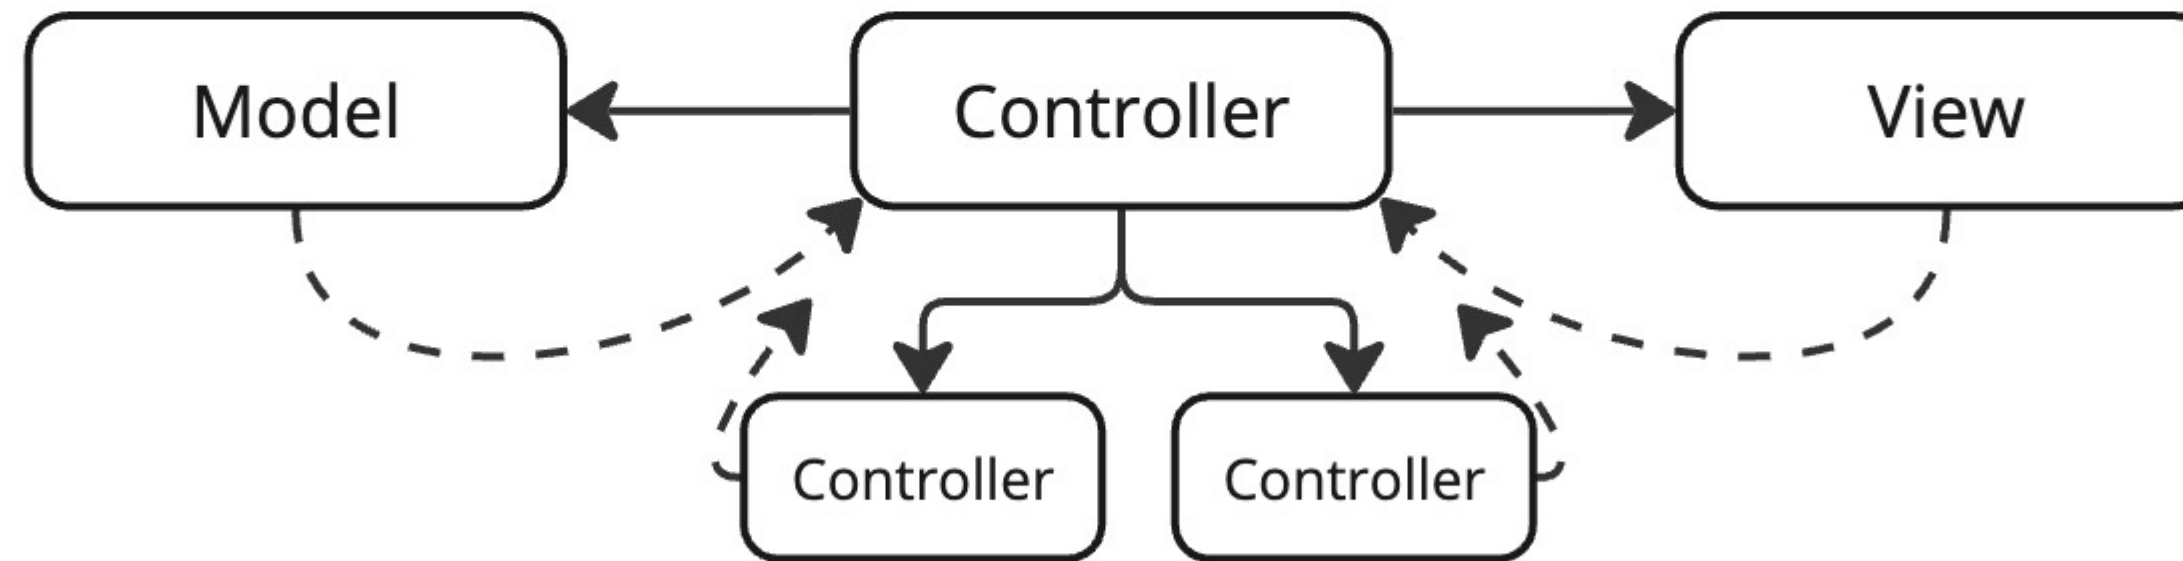

(Or am I using it wrong?)

Created by:
@pedro0x53

- App Entities/Data Models;
- They can be DDD (smart models);
- They can be accessed through a **Data Mapper**, or be **Active Record**;

Persistence Design
Patterns

- **Mediator** (design pattern)
between the constructs (classes,
entities, etc.) that hold the
business rules;

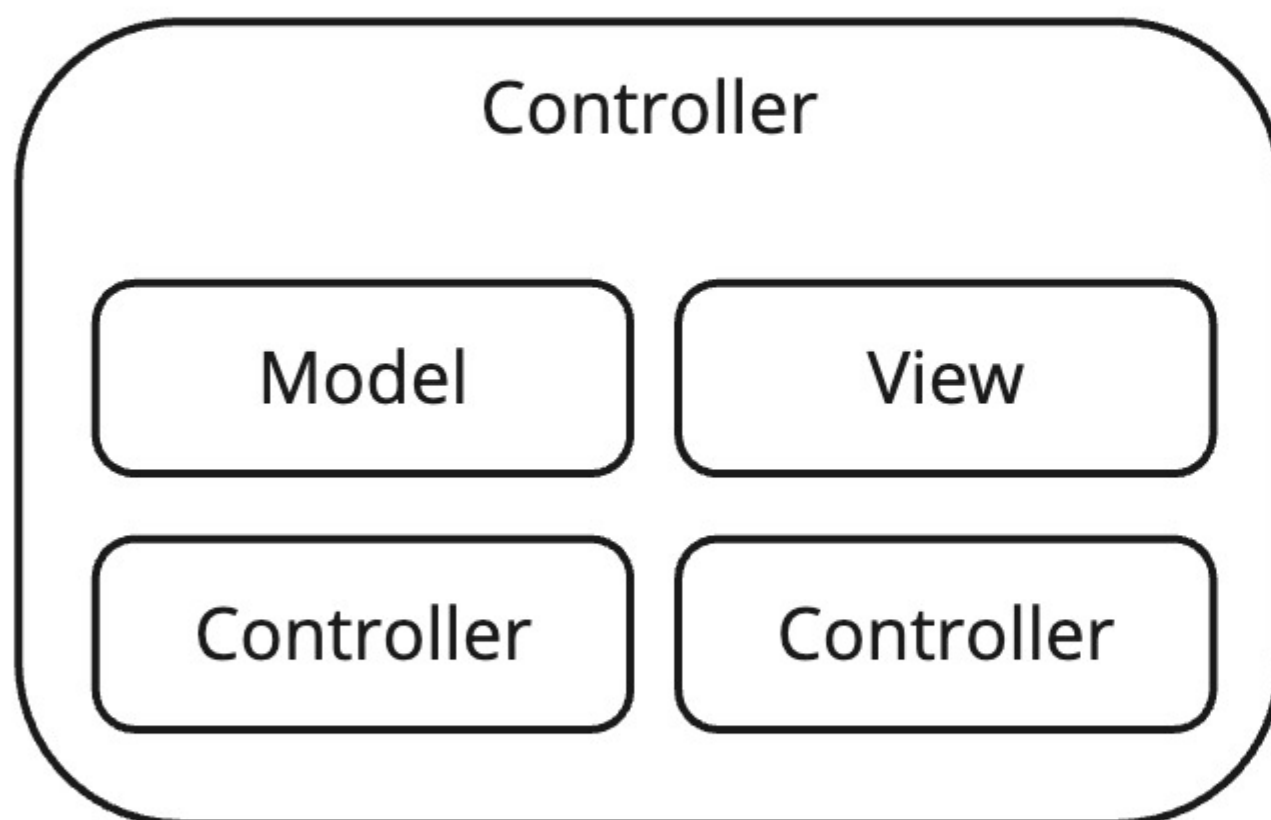

- The interface;
- It contains the
view states;

- A **NetworkManager** is a network controller;
- A **FileManager** is a file controller;
- A **Coordinator** is a navigation controller;

*Don't be afraid to create a new *controller*, or your *controller* will become **massive**;

Architectural Composition Who contains whom?

The main Controller contains and mediates the interaction and communication between the View, Model, and other controllers.

Sequence Diagram
