

MVVM - The "solution" for MVC

(now, my ViewModel is massive, or am I using it wrong too?)

Created by
@pedro0x53

- The UI;
- It has a **ViewModel** as a property;

- Specific facade for Navigation/Traffic Flows;
- Commonly known as **MVVM-C** or **MVVM+**;

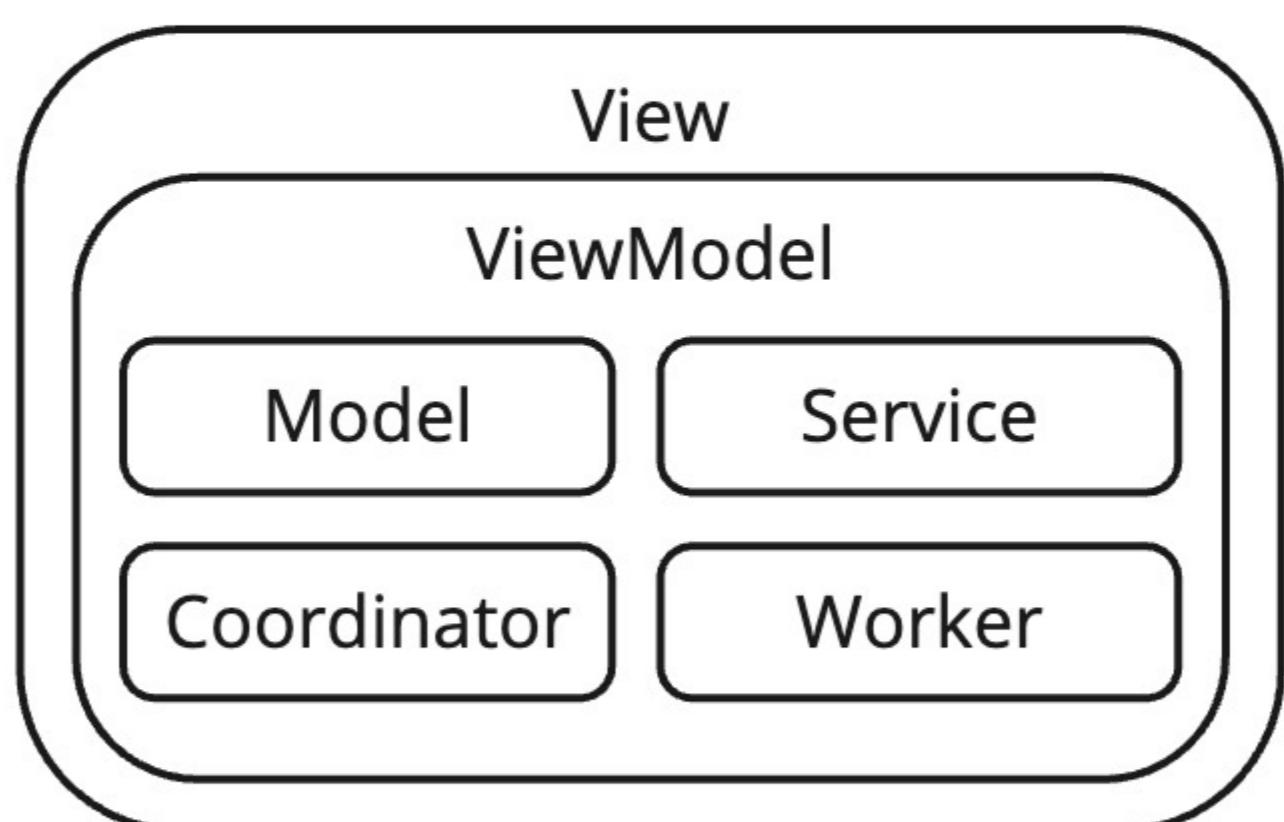

- **Facade** (design pattern) for the information needed for the View;
- Abstracts the service call for the app's features;
- **SSoT** of the View;
- Implements simple business rules, or uses a service to execute the business rule;

- App data entities/models;
- They can be **DDD** (smart models);
- They can be accessed through a **Worker** (Repository, Data Mapper), or be **Active Record**;

- **Facades** for more complex subsystems/services such as Web Requests, Databases, File Handling, and Mathematical Calculations;

Architectural Composition

Who contains whom?

All requests from the View go through the ViewModel.
